THE APPLICATION IDENTIFIED ABOVE HAS BEEN EXAMINED AND IS ALLOWED FOR ISSUANCE AS A PATENT. **PROSECUTION ON THE MERITS IS CLOSED.** THIS NOTICE OF ALLOWANCE IS NOT A GRANT OF PATENT RIGHTS. THIS APPLICATION IS SUBJECT TO WITHDRAWAL FROM ISSUE AT THE INITIATIVE OF THE OFFICE OR UPON PETITION BY THE APPLICANT. SEE 37 CFR 1.313 AND MPEP 1308.

THE ISSUE FEE AND PUBLICATION FEE (IF REQUIRED) MUST BE PAID WITHIN **THREE MONTHS FROM THE MAILING DATE OF THIS NOTICE** OR THIS APPLICATION SHALL BE REGARDED AS ABANDONED. **THIS STATUTORY PERIOD CANNOT BE EXTENDED.** SEE 35 U.S.C. 151. THE ISSUE FEE DUE INDICATED ABOVE DOES NOT REFLECT A CREDIT FOR ANY PREVIOUSLY PAID ISSUE FEE IN THIS APPLICATION. Examiner's Amendments / Reasons for allowance

1. The following is an Examiner's statement for reasons for allowance:

Claims 1-14 are considered allowable since when reading the claims in light of the specification, as per MPEP §2111.01, none of the references of record alone or in combination disclose or suggest the combination of limitations specified in independent claims, including a logic circuit comprising: an input data node for carrying input data; a configurable logic block (CLB) control logic circuit having a first input, a second input, a third input, a forth input and an output; at least one look-up table in which a switching function of at least one conditional branch is implemented with content addressability, wherein the at least one look-up table generates an 'if then else' branch that realizes a comparison of the input data with comparison data previously stored in the at least one look-up table, and wherein a result output of the at least one look-up table is provided to the third input of the CLB control logic circuit; an input data bus coupled between the input data node and a bus input of the at least one look-up table, wherein the first input of the CLB control logic circuit is coupled to the input data node via the input data bus. at least one multiplexer having a control input coupled to the input data node and also to the first input of the CLB control logic circuit via at least part of the bit width of the input data bus, an output of the at least one multiplexer being coupled to the forth input of the CLB control logic circuit; a control input node coupled via a control bus to the second input of the CLB control logic circuit; and at least one register data bus coupled between

a register data bus output of the at least one look-up' table and a bus input of the at least one multiplexer.

2. The closest prior art (U. S. Patent Publication 20020152060, referred to as **Tseng**) teaches an input data node for carrying input data (**Tsang**, ¶[0523]); and an input data bus coupled between the input data node and a bus input of the at least one look-up table, wherein the first input of the CLB control logic circuit is coupled to the input data node via the input data bus. (**Tseng**, ¶[0242])

Additional prior art ('Logic and Computer Design Fundamentals', referred to as **Mano**) teaches a configurable logic block (CLB) control logic circuit having a first input, a second input, a third input, a forth input and an output (**Mano**, Page 351, figure 7-5 (The components of the OR gate, the MUX and the load comprise the control logic circuit); The CLB control logic can be anything. This figure illustrates the four inputs being K1, K2, output of R2 and output for R1. There is a fifth input for the clock (See claim specification) the output is Q_0 - Q_3 from R0.)

3. The references either by themselves or in combination fail to teach at least one look-up table in which a switching function of at least one conditional branch is implemented with content addressability, wherein the at least one look-up table generates an 'if then else' branch that realizes a comparison of the input data with

comparison data previously stored in the at least one look-up table, and wherein a result output of the at least one look-up table is provided to the third input of the CLB control logic circuit; at least one multiplexer having a control input coupled to the input data node and also to the first input of the CLB control logic circuit via at least part of the bit width of the input data bus, an output of the at least one multiplexer being coupled to the forth input of the CLB control logic circuit; a control input node coupled via a control bus to the second input of the CLB control logic circuit; and at least one register data bus coupled between a register data bus output of the at least one look-up' table and a bus input of the at least one multiplexer.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled 'Comments on Statement for Reasons for Allowance.'
